WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports (Form 86ab) rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is promptly requested and the fact that they have been so questioned is indicated by the symbol (:).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparison with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per 1000 mean strength which would occur over a year's time if the current week's experience continued through the year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases of the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per 1000 strength, as given in this report, furnishes an approximation to the current non-effective rate. The mean number of non-effectives per 1000 strength is given in the summary table for the total United States and for each of the Service Commands.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities and college training detachments are not included in this report.

In the case of general hospitals there are shown, in addition, the total number of patients admitted and disposed of each week, the number of patients admitted by transfer and the number of battle casualties admitted and disposed of.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) has been placed after admission rates computed on the basis of 5 or fewer cases.

The symbol # has been placed after the names of stations (or groups of stations) where part or all of the data for the current week has not been received and the latest available figures have been substituted.

WEEKLY HEALTH REPORT

WEEK ENDING 6 NOVEMBER 1943

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both increased slightly during the week ending 6 November 1943 but were nevertheless about 5 percent below the corresponding week in 1942. The lower morbidity rates shown in the chart for the last two weeks reflect a correction made for the Tennessee Maneuver Area; for the last week this was responsible for a lowering of the admission rate from all causes by 22 points, from all diseases combined by 16 points, and from injury by 6 points. It now appears that the morbidity rates for the entire United States in the preceding weeks are actually somewhat lower than shown.

The rate of admission from colds, influenza, etc. continues at a low level and for the current week is almost 50 percent under the rate prevailing during the corresponding period in 1942.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

The marked reductions in the admission rates from those reported previously in the Fourth Service Command reflect the correction made for the Tennessee Maneuver Area; it now appears that this Service Command did not during the past several months have the abnormally high rates of morbidity shown. During the past week noteworthy increases in the admission rates from all causes and from all diseases combined occurred in the Sixth, Seventh, and Ninth Service Commands, while decreases were registered in the Third Service Command and the Military District of Washington.

The admission rate from colds, influenza, etc. increased sharply in the Sixth and Seventh Service Commands to figures in excess of 150 per thousand strength, and the Second Service Command continued to report about 140 per thousand; in the other Service Commands the rate remained relatively low, the Fourth and Eighth Service Commands being the lowest.

VARIATIONS IN MORBIDITY BY STATIONS

The table on page 24 shows the 5 stations (with strength of 5,000 or over) having the highest morbidity rates for certain causes. The excessively high admission rates from all causes and from all diseases combined are more apparent than real since in most instances they reflect the reporting of venereal diseases existing prior to induction among selectees known to have uncomplicated cases. For example, the all causes rate for Fort Benjamin Harrison, a reception center, would be reduced from 3233 to 995 per thousand strength if these venereal EPTI cases were excluded.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity increased by about 4,000 and on 6 November 1943 was practically 350,000. The number of beds occupied on that date was about 187,000, and the number of "available vacant" beds almost 95,000. There were 35 stations with a total bed capacity of about 22,000 which had no "available vacant" beds; included among them were 7 general hospitals with a bed capacity of about 3,500 beds.
